FastingBS: 1
RestingECG: Normal
MaxHR: 138
ExerciseAngina: Y
Oldpeak: 2.1
ST_Slope: Flat

Prediction Result

Prediction: Heart Disease Detected
Risk Score: 94.27%

Risk Explanation

Based on the patient data, here's an explanation of the prediction:

* **Risk Level**:

- * The patient is at a high risk of having a heart disease, with a risk score of 94.27%.
- * This indicates that the patient has a significant chance of experiencing a heart-related event.

* **Important Factors**:

- * Age (58 years): Increasing age is a risk factor for heart disease.
- * High Resting Blood Pressure (145 mmHg): Elevated blood pressure can damage the heart and blood vessels.
- * High Cholesterol (265 mg/dL): High cholesterol levels can lead to the buildup of plaque in the arteries.
- * Exercise Angina (Yes): Chest pain during exercise is a symptom of heart disease.
- * Oldpeak (2.1): This value indicates some level of heart damage or disease.

* **Precautions**:

- * Regular health check-ups to monitor blood pressure, cholesterol, and blood sugar levels.
- * Follow a doctor-recommended treatment plan, including medications and lifestyle changes.
- * Be aware of symptoms such as chest pain, shortness of breath, or dizziness, and seek medical help immediately if they occur.

* **Lifestyle Suggestions**:

- * Quit smoking (if applicable) to reduce the risk of heart disease.
- * Engage in regular physical activity, such as walking or other low-intensity exercises, as recommended by a doctor.
- * Follow a healthy diet that is low in saturated fats, sodium, and added sugars.
- * Maintain a healthy weight to reduce the risk of heart disease.
- * Manage stress through relaxation techniques, such as meditation or deep breathing exercises.

Personalized Recommendation

****Summary:****

*** **Latest findings:****

* The American Heart Association (AHA) has released new dietary guidelines for 2026, emphasizing the importance of a heart-healthy eating pattern in reducing the risk of cardiovascular disease and related conditions.

* A heart-healthy diet centers on fruits, vegetables, whole grains, plant-based proteins, and unsaturated fats, while limiting sugar, sodium, and ultraprocessed foods.

*** **Important discoveries:****

* Early and consistent adoption of healthy eating habits, alongside other healthy lifestyle behaviors, could help prevent up to 80% of heart disease and stroke.

* The AHA recommends a diet with lots of vegetables, fruits, legumes, nuts, whole grains, lean vegetable or animal protein, and fish to help maintain a healthy weight.

*** **How it relates to this patient:****

* The patient's prediction indicates a high risk of cardiovascular disease (risk score: 94.27), making it essential to adopt a heart-healthy lifestyle.

* The patient's current data shows high cholesterol (265) and resting blood pressure (145), which can be improved through dietary changes and other lifestyle modifications.

*** **Actionable recommendations:****

* Follow the AHA's 9 key dietary steps to reduce the risk of cardiovascular disease.

* Eat more low-calorie, nutritious foods such as fruits and vegetables.

* Limit sugary, salty, and ultraprocessed foods.

* Incorporate heart-healthy proteins, such as lean vegetable or animal protein, and fish into the diet.

* Adopt the 5-step heart-healthy eating pattern recommended by the Heart Foundation to achieve a balanced diet.

* Monitor and manage cholesterol and blood pressure levels through regular check-ups and lifestyle modifications.
